TABLE OF CONTENT

How do members and casual riders use Cyclistic bikes differently?

01 THE "WHO"
(User Proportion)

02 THE "WHEN"
(Daily Usage Patterns, Hourly Demand & Monthly Trends)

03 THE "HOW LONG"
(Typical Ride Length)

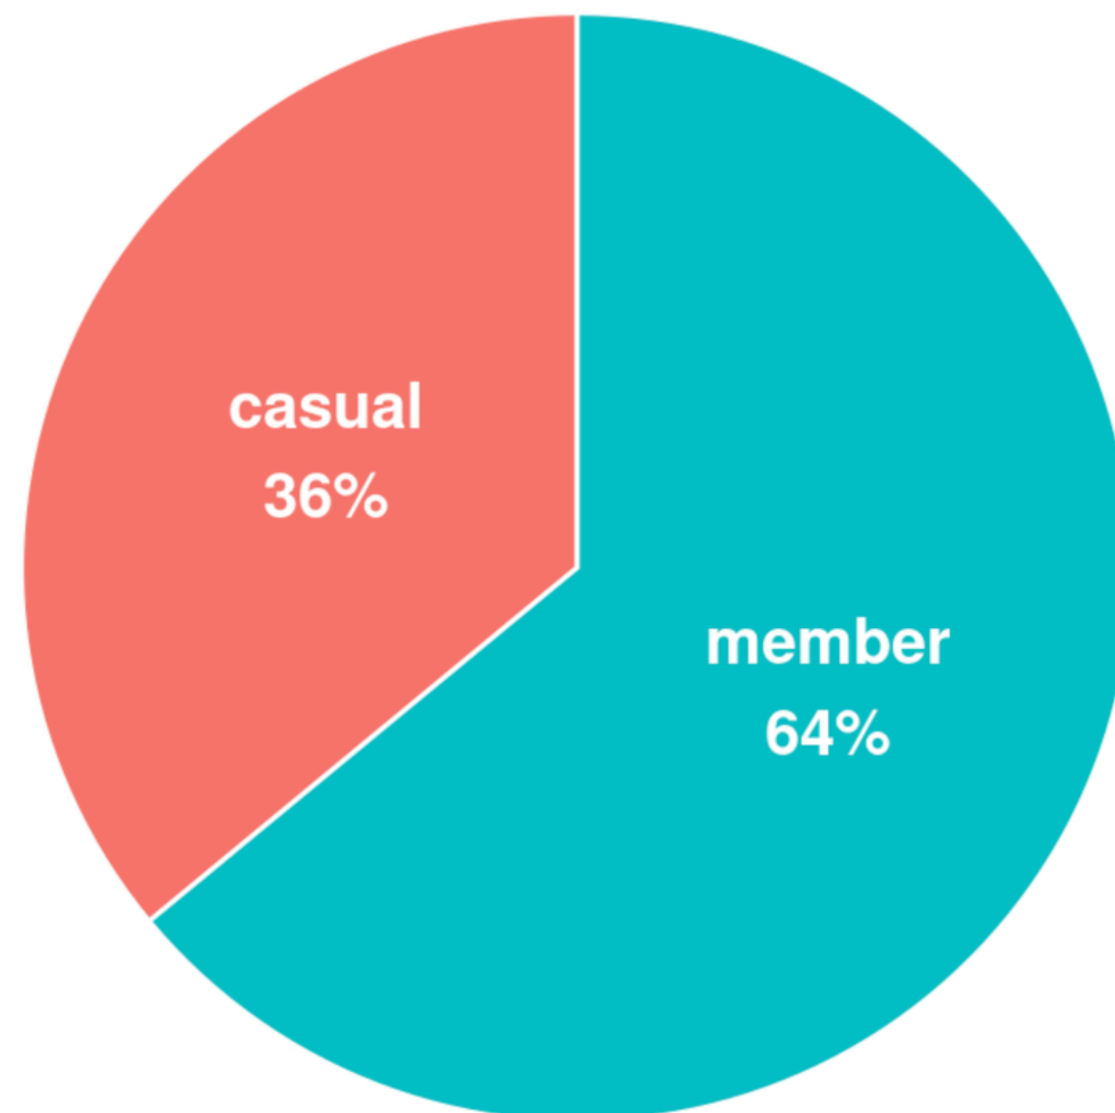

04 THE "BEHAVIORAL SPREAD"

Cyclistic 

Total Ride share : Casual vs Members

Percentage of total trips taken in 2025

The "Who"

 User Proportion

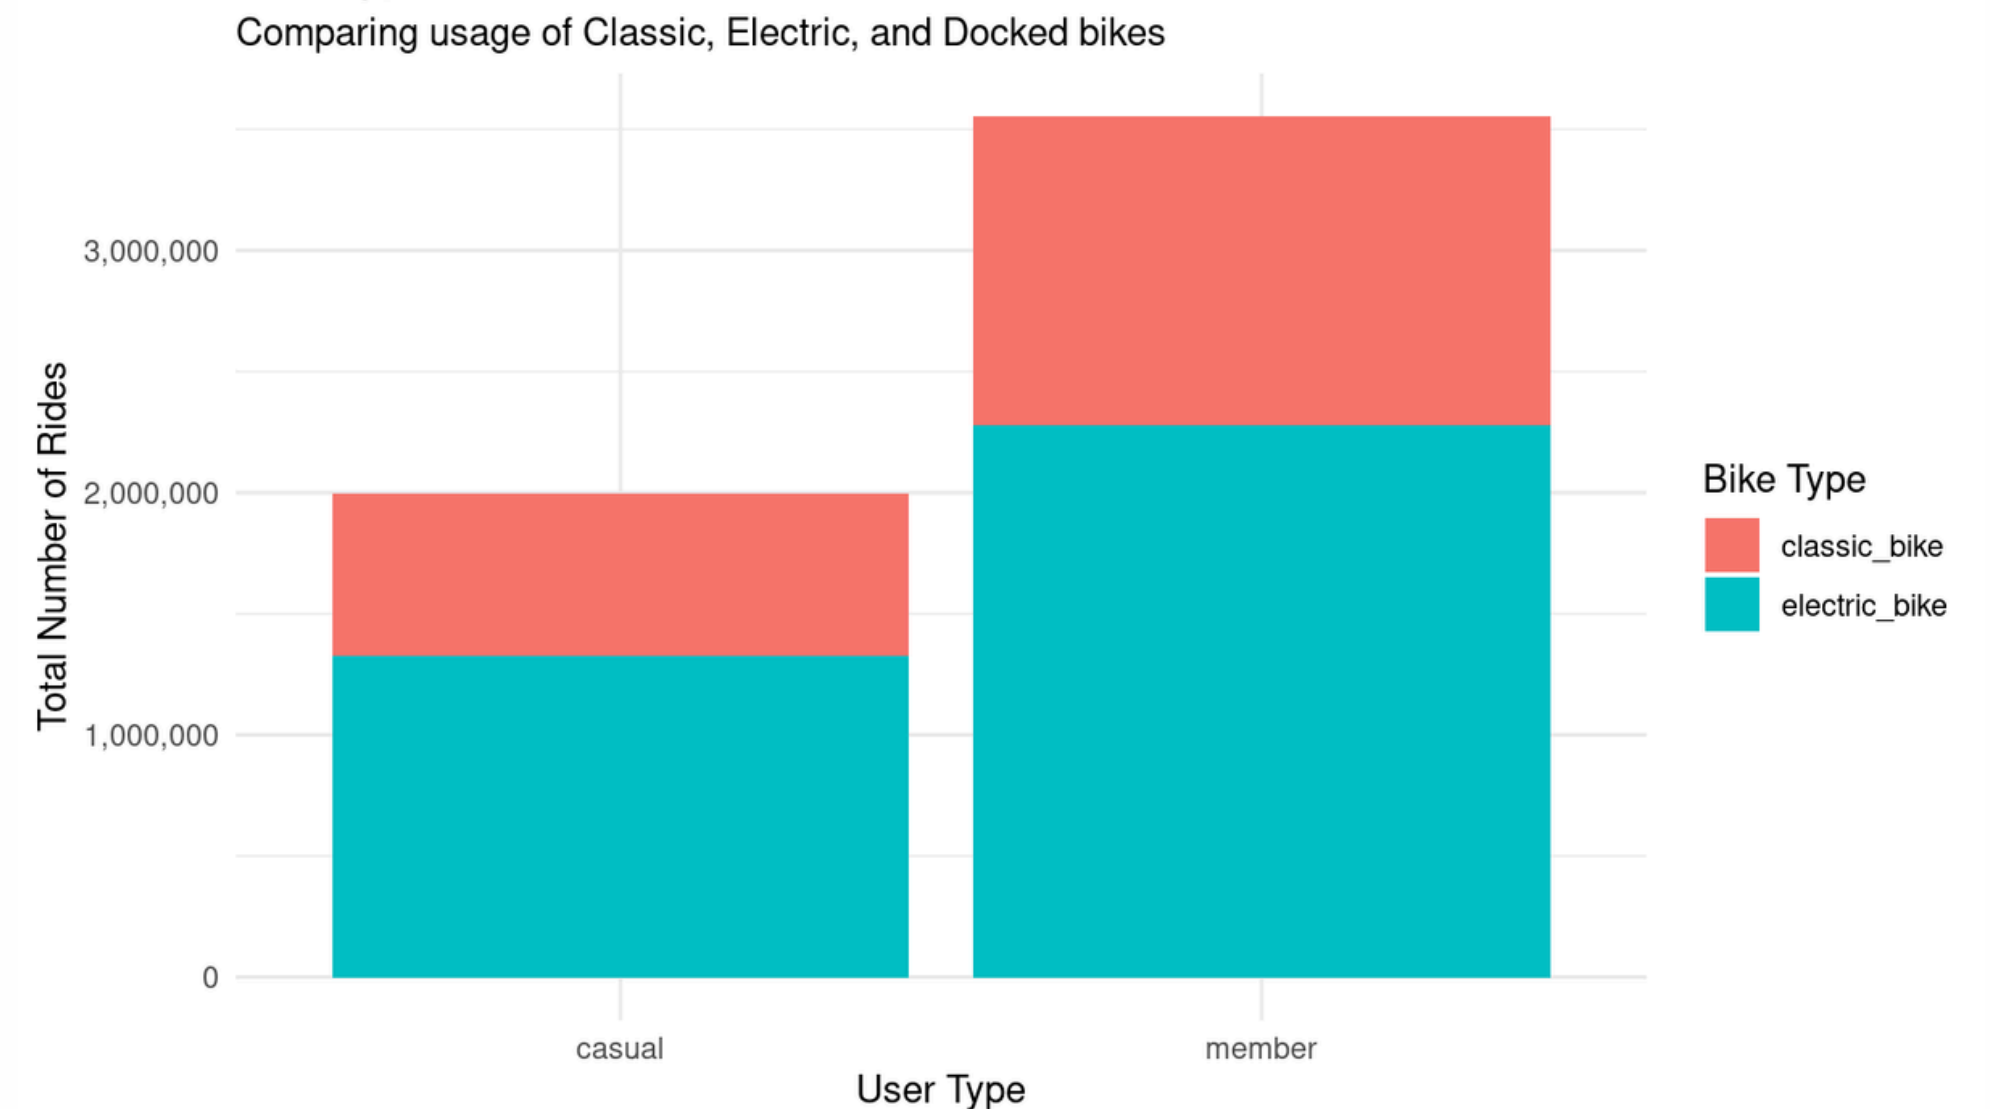

Members make up **64%** of our total rides, but Casual riders still represent a massive opportunity for conversion **36%**.

Bike type preference : Casual vs Members

■ Bike type Preference

Almost identical for both groups:

- Electric bikes dominate
- Classic bikes $\approx 25\%$ of rides

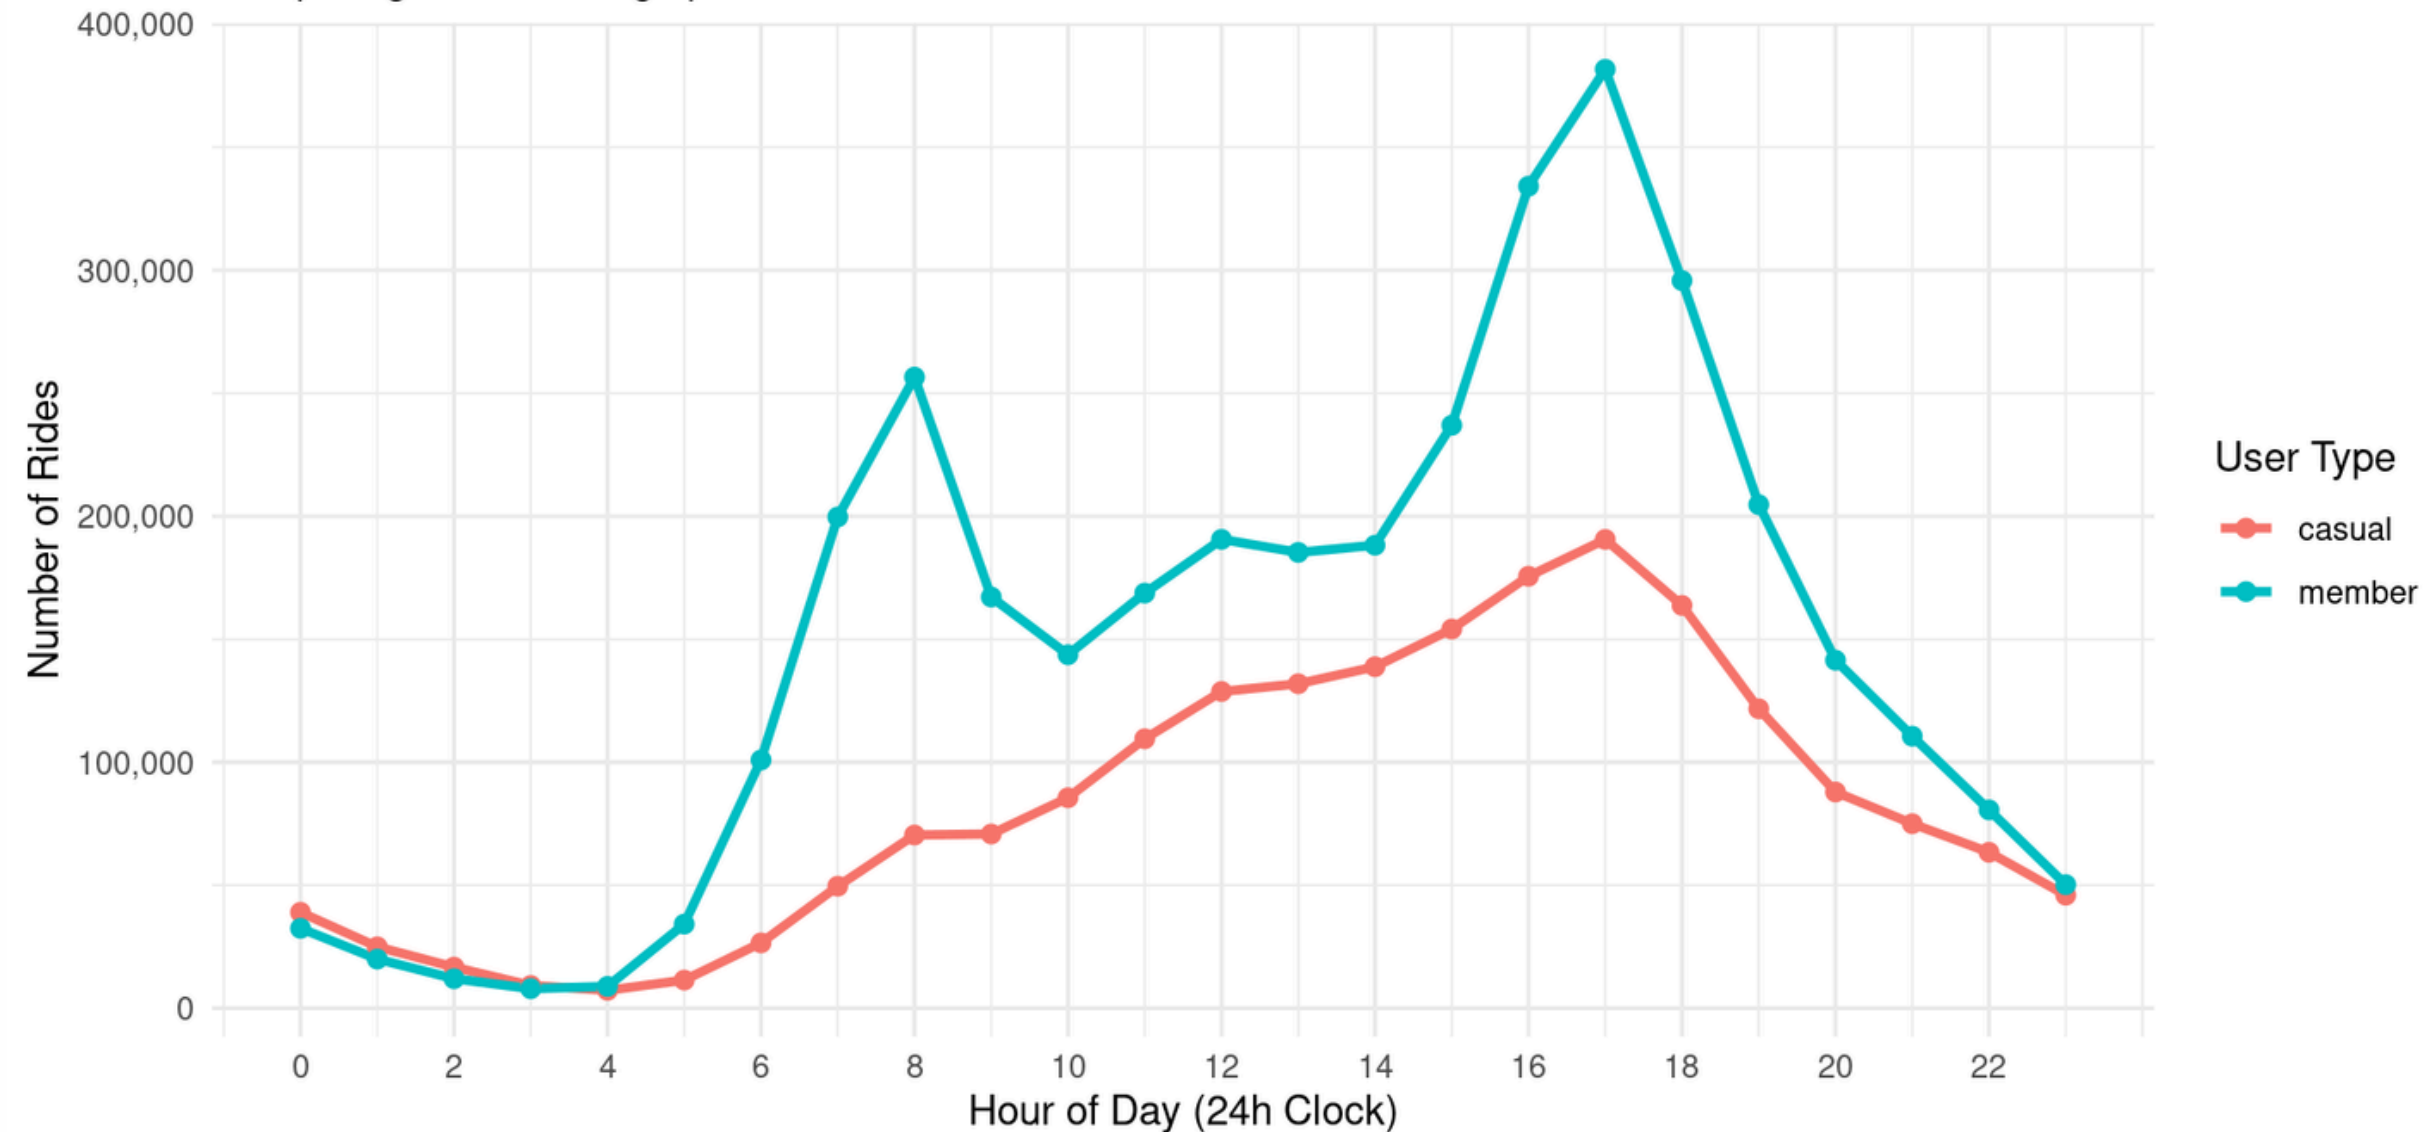

This suggests that bike-type demand is driven by variables other than membership status.
(More data needed to confirm this)

Feb, 16

Hourly Bike demand : Casual vs Members

Comparing 24-hour usage patterns

The "When"

■ Hourly Demand

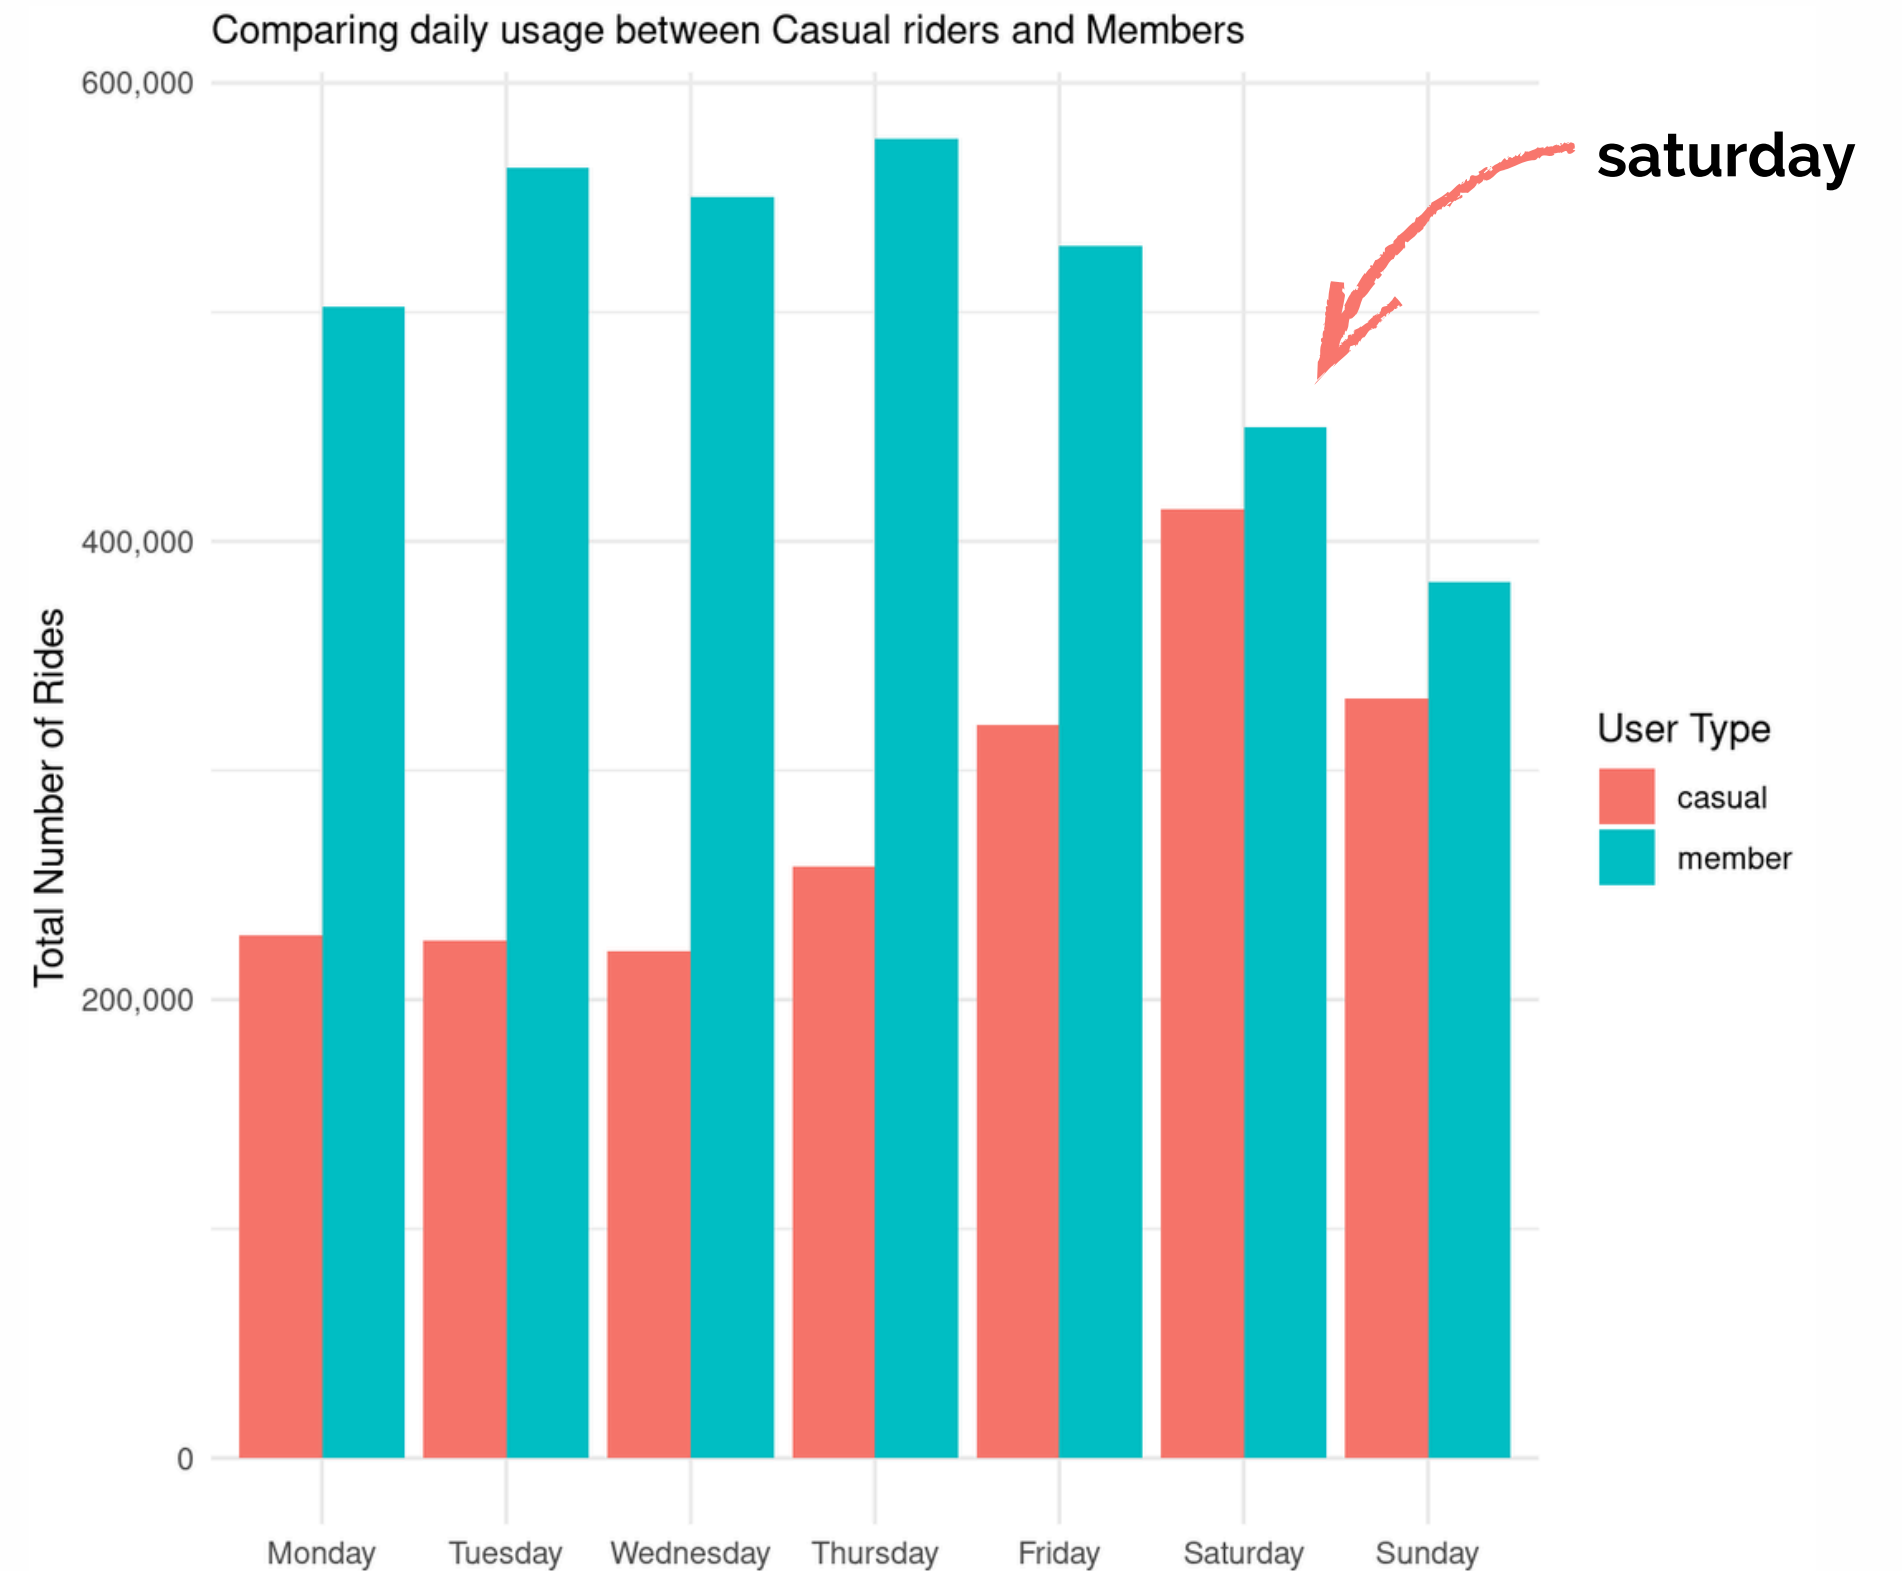

- **Annual Members** → clear peaks: 8 AM & 5 PM (commuters)
- **Casual Riders** → main peak at 5 PM (leisure, tourism, or evening activities)

More granular data (demographics, trip origins/destinations, user surveys) is needed to fully confirm rider profiles and motivations.

Number of rides by day of week : Casual vs Members

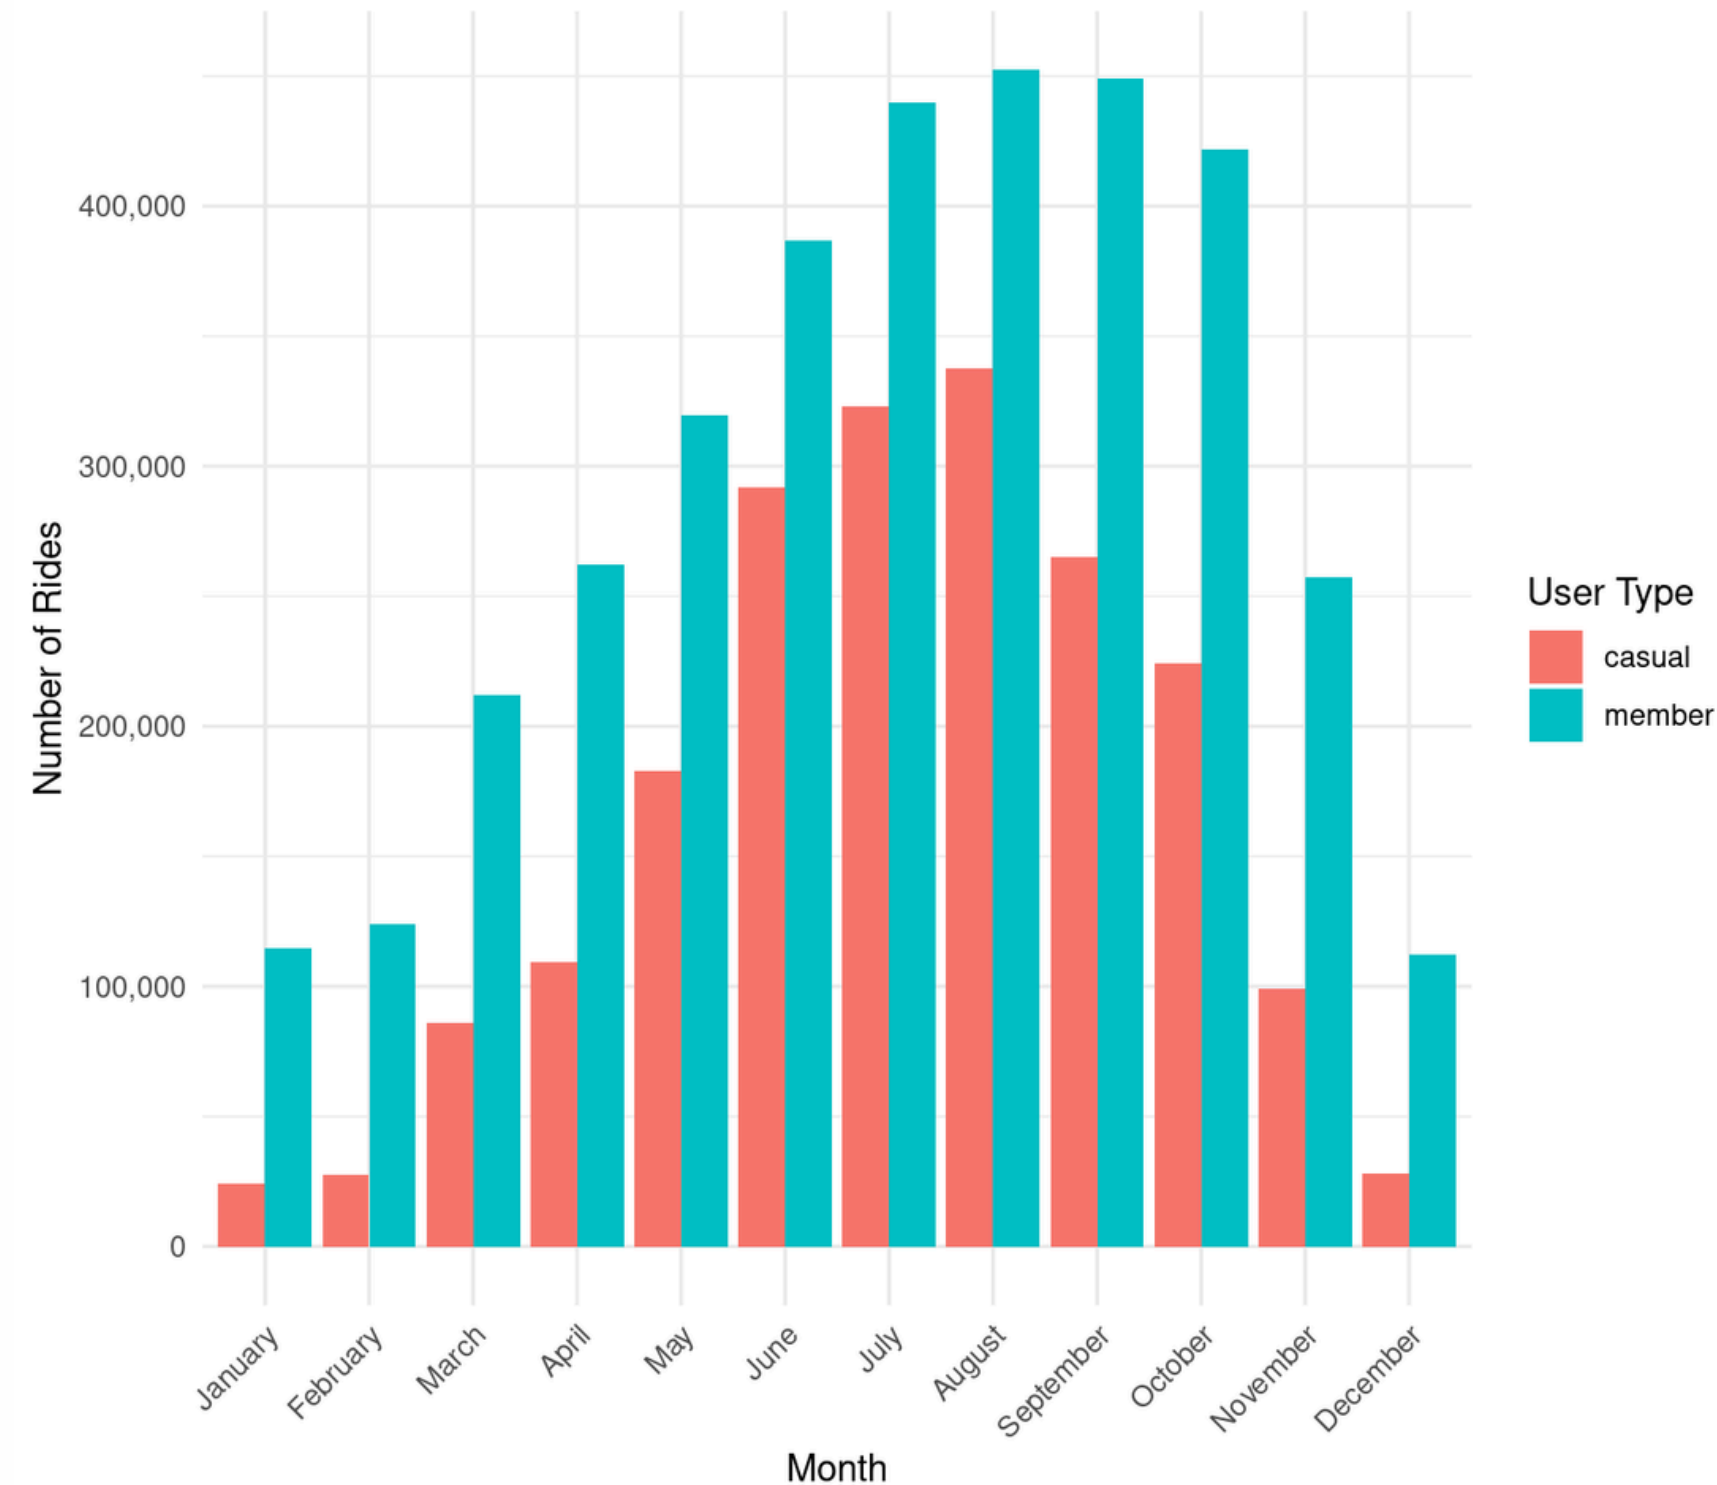

■ Daily Usage

- Annual Members → peak & stable during workweek, lower on Sat/Sun
- Casual Riders → consistent volume, with increase on weekends

Total Rides per Month : Casual vs Members

Comparing seasonal trends between user types

Seasonality

Monthly Trends

- **Members**: Peak in Aug–Sep (highest in August)
- **Casuals**: Peak in Jul–Aug (highest in August)
- Both: Lowest in Jan & Dec (winter months: Cold temperatures + precipitation drastically reduce usage for both groups)

The "How Long"

■ Ride Length/Duration

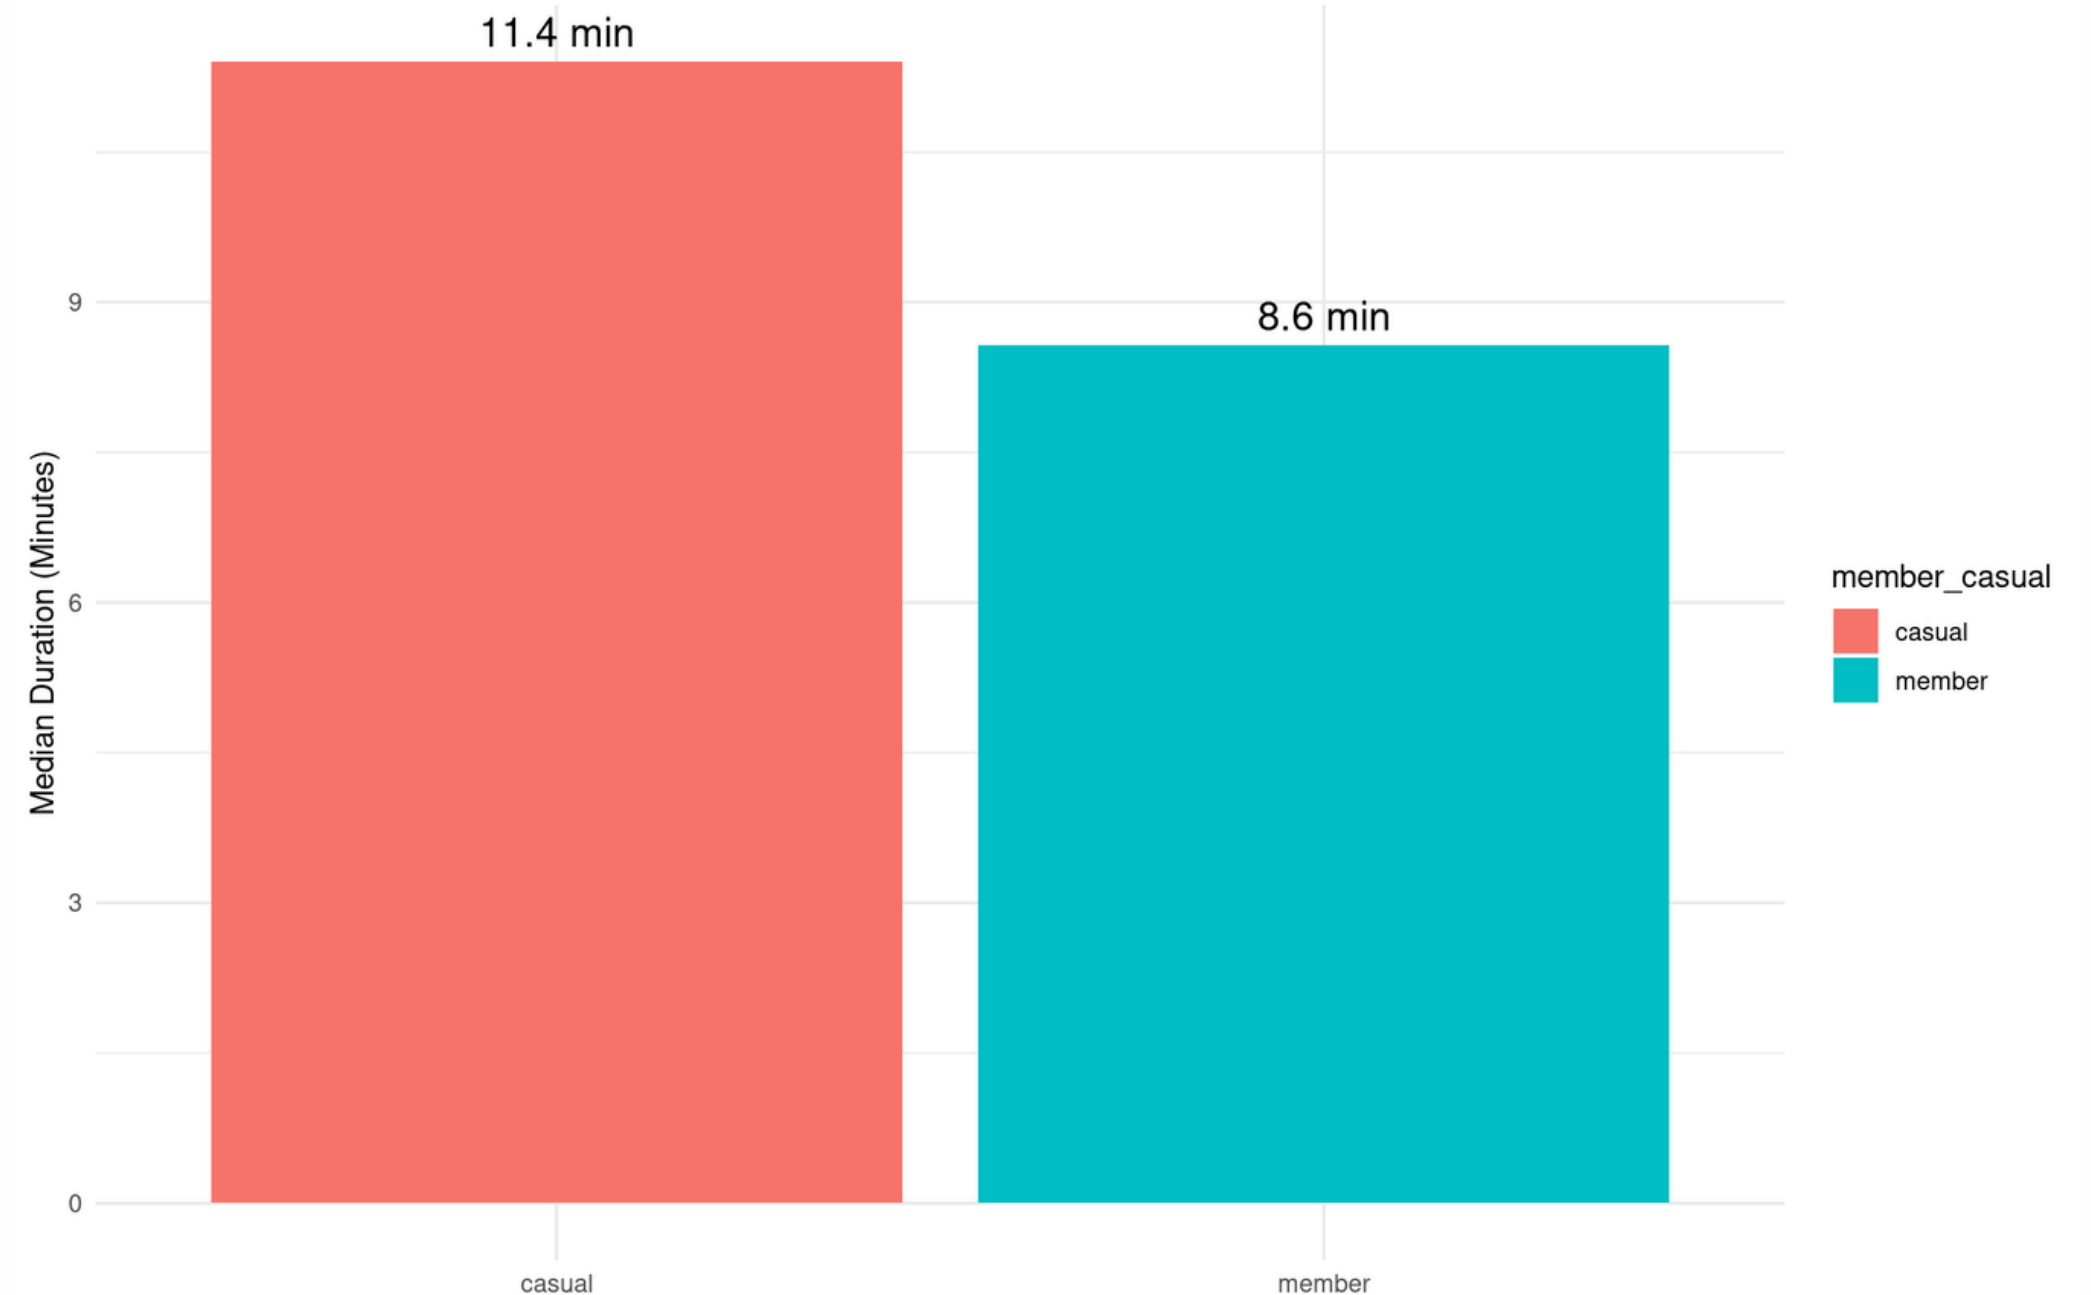

- **Annual Members:** 8.6 minutes
- **Casual Riders:** 11.4 minutes

→ Casual rides are ~33% longer on average

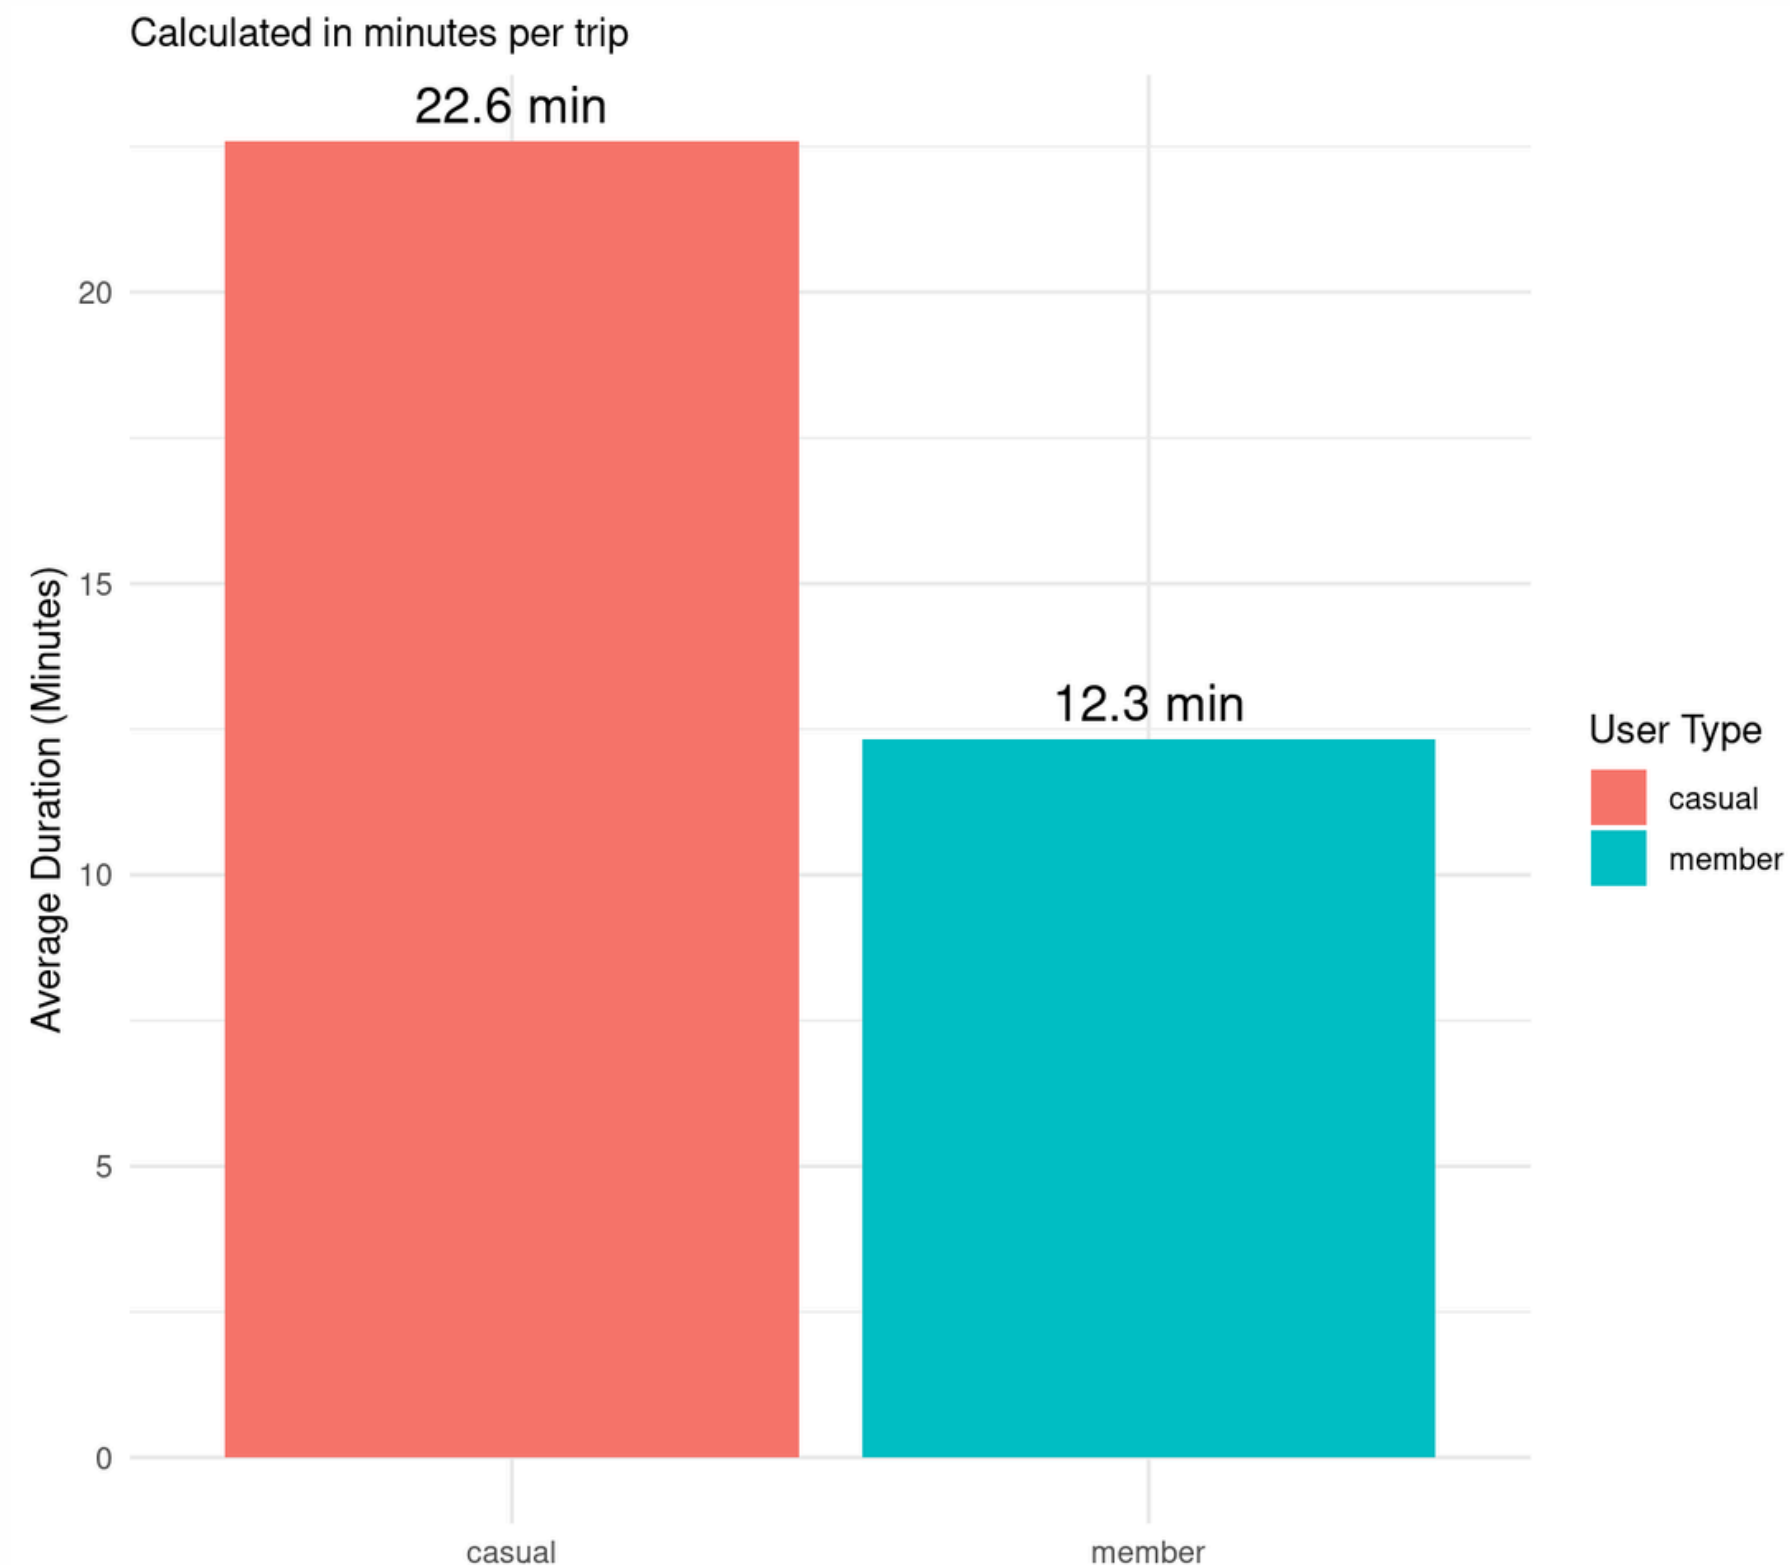

- Why median? More reliable than average: excludes long outliers (e.g. forgotten bikes, joyrides)

Median Ride duration: Casual vs Members

The 'Typical' ride length, ignoring extreme outliers

Average Ride Duration : Casual vs Members

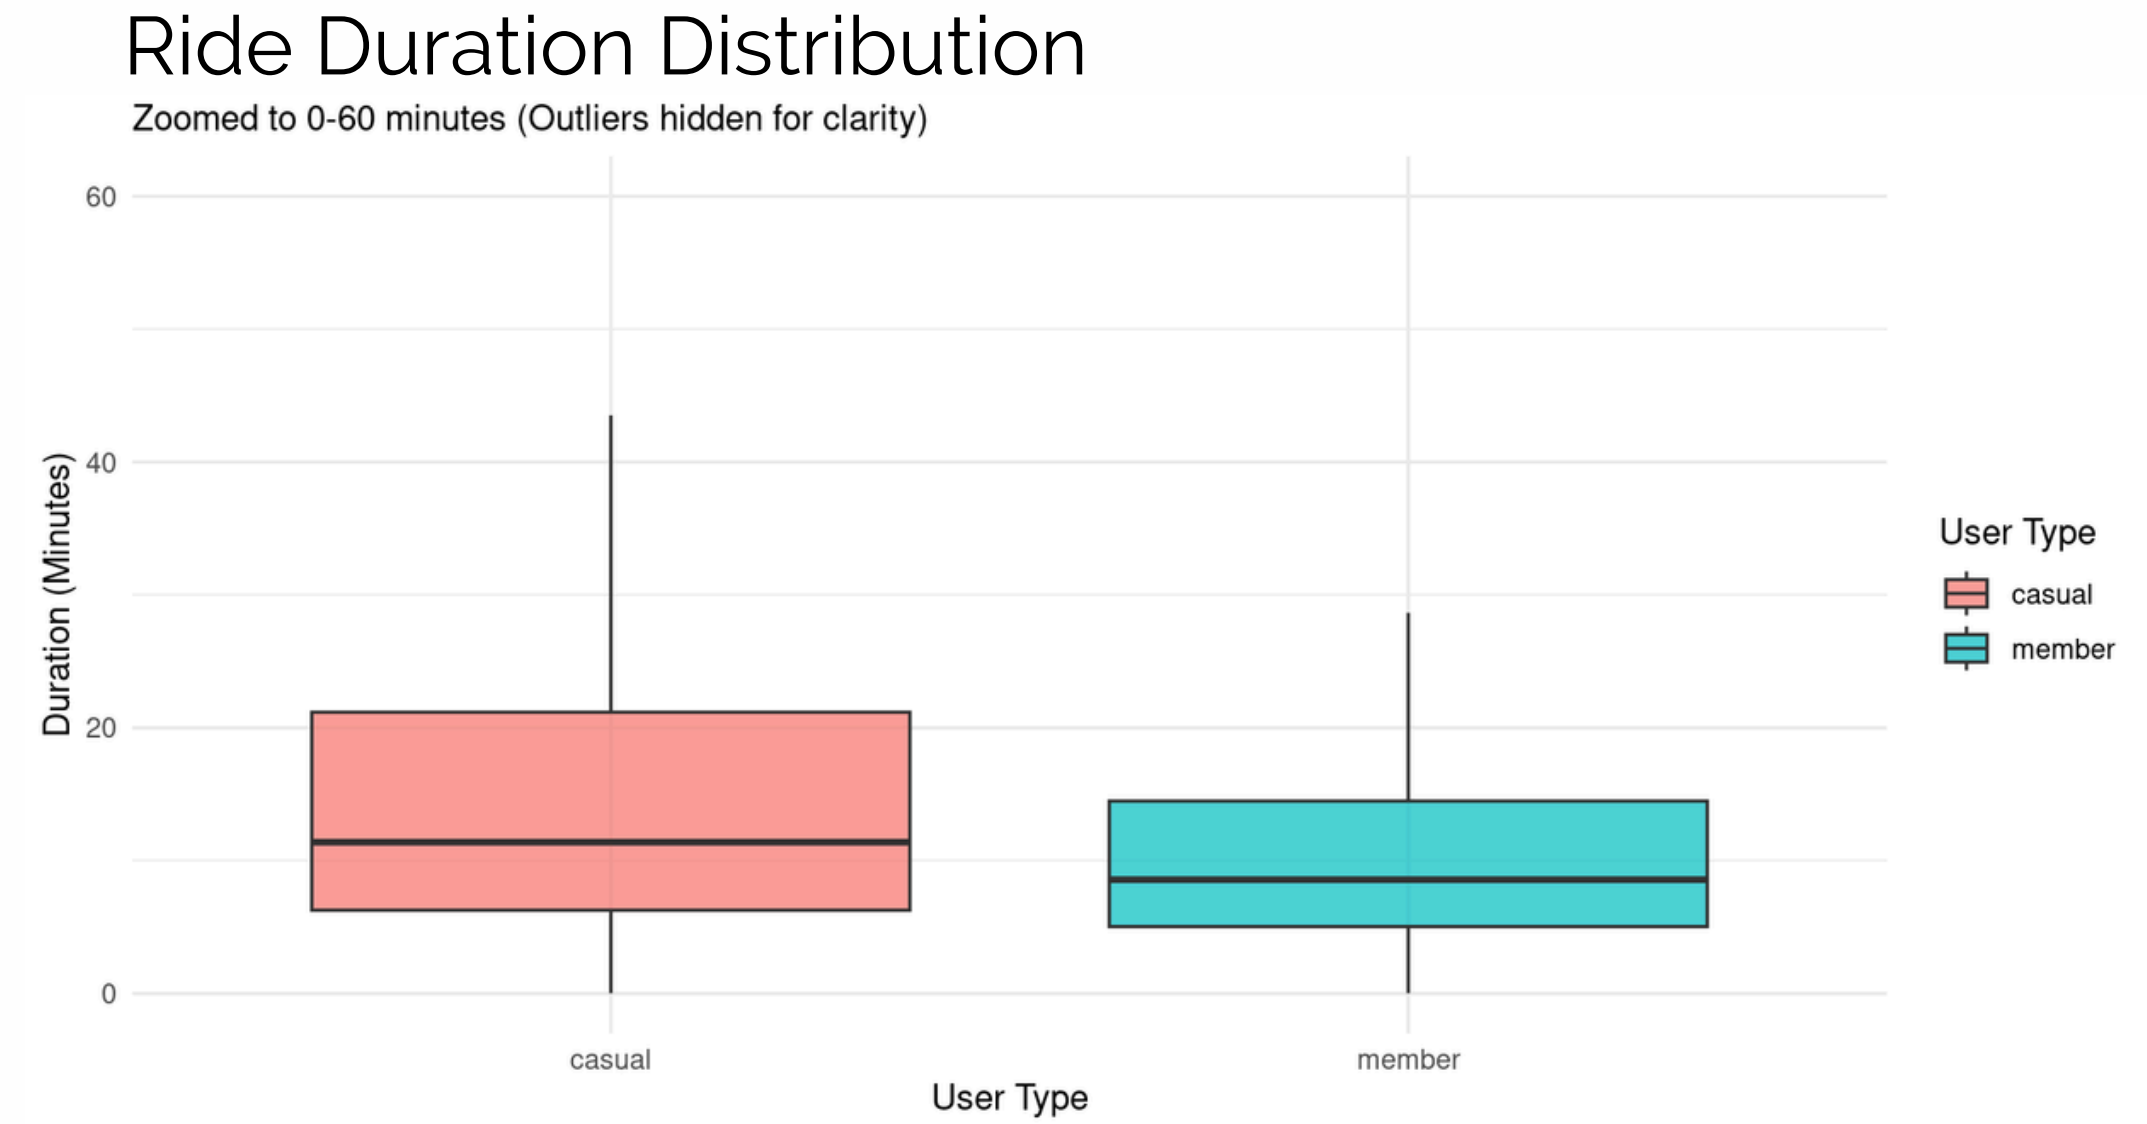

Casuals average longer rides (22.6 min) than members (12.3 min)
Consistent with the Median

The "Behavioral Spread"

Boxplot

- **Members:** Short, tight box → consistent, quick utility trips (e.g., commuting)
- **Casuals:** Tall box + wide spread → highly variable, mostly recreational/leisure rides
- Casuals show many extreme outliers → some very long trips (tourism, sightseeing, full-day use) pull the average much higher than the median

Marketing Implications

Recommendations (1/2)

Launch the "Weekend" Membership

Since Casual riders dominate the weekends for leisure, offer a lower-cost "Saturday-Sunday Only" pass. It's the perfect gateway to a full annual membership for people who already use the bikes for fun.

The "Commuter Conversion" play

Since the data shows Members dominate the 8 AM rush, target Casual riders who already ride during that window. Send them a "Commuter's Week" pass, a 5 days of member-style pricing, to let them see how much they save on a daily basis

Recommendations (2/2)

E-Bike Member Priority Perks

Since 75% of users prefer E-bikes, make membership the "VIP" way to access them or Offer Members a lower per-minute rate for Electric bikes compared to Casual riders.

Target the "Heavy" Casuals

Based on the Boxplot insights. We can Identify the "high-duration" Casual riders (those consistently riding 30+ minutes). Show them a cost-comparison ad: "You've spent \$X on single rides this month, an Annual Membership would have only cost \$Y. Switch now and save."

Seasonal "Lock-In" Deals:

In August (Casuals peak month), offer a "Membership Credit." Casual riders can have 50% of their August ride fees be applied toward the cost of an Annual Membership if they join by September 1st. This captures them at their highest point of interest.

Marketing Implications
